

Tune up your IT projects.

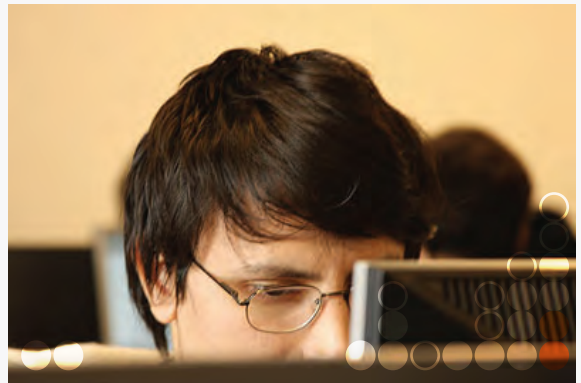

We examine and evaluate your company's IT initiatives so as to get the most out of your technology assets.

Your organization's IT project is ready to be implemented. Or maybe, your IT systems have grown in a complex and disorganized way and you ignore their current situation. In both cases our software architects can help you examine, evaluate and tune up the design and planning of your technology projects so as to optimize your assets and drive better business results.

We examine your company's IT strategy and evaluate your systems or current IT Project, taking into account of best practices, and helping you implement infrastructure solutions capable of cost-effectively supporting your business goals today and tomorrow. When appropriate, we will include recommendations for future improvements.

As part of our Software Architecture Analysis service, a Business Vision team of experts will work for you to:

- Examine your system documents, current workflow, IT assets and performance.
- Interview key personnel of your company
- Analyze the information that has been gathered and compare it with the future state you want to achieve.
- Identify implementation troubleshoots and determine the architectures changes needed to achieve the company's goals.

Through our Software architecture analysis service you will be able to optimize and improve your technology systems, and make sure your IT initiatives are fully aligned with your business strategy.

Keys

We help you analyze the key factors that boost your business from four different points of view:

Commercial

What are you going to use this architecture for?

Functional

What this architecture is supposed to do?

Technical

How can this architecture be built?

Implementation

How can this architecture be implemented with?
