

Quality and reliability for your developments.

We audit, track and test your developments to ensure quality, performance and security compliance.

Reliability and quality are two key factors for the success of any technology implementation. Yet, mostly low budgets and time to market pressures diminish the final quality of software applications. Never has the need for more rigorous quality discipline been as great as today.

Our team of analysts can help you do that by establishing and creating quality indicators to verify, control and detect software flaws throughout the development lifecycle.

We offer comprehensive Quality Assurance services that allow companies to improve the functionality, usability, reliability, and scalability of their most important software applications and meet their business objectives.

Our Quality Assurance services include:

Code quality:

Run-time analysis, memory leak detection, performance profiling, and component testing.

Testing:

Automated and manual functional and performance testing of a wide array of applications.
